Referral for Total Knee Arthroplasty

Patient:	Jane Doe (PAT-883910)
Date of birth:	1958-03-11
Referring provider:	Dr. Michael Chen, MD — Orthopedic Surgery
Date of letter:	2026-09-17
Procedure requested:	Total knee arthroplasty, right knee (CPT 27447)
Diagnosis:	Severe osteoarthritis, right knee (ICD-10 M17.11)

This letter is to formally refer the above patient for evaluation and surgical management of advanced osteoarthritis of the right knee. The patient has been under conservative management for approximately five months, including NSAIDs, a supervised physical therapy program (attendance records on file), and two corticosteroid injections, with continued significant functional limitation and pain refractory to non-operative treatment.

Radiographic imaging (attached separately) demonstrates bone-on-bone tricompartmental joint space narrowing with subchondral sclerosis and osteophyte formation, consistent with Kellgren- Lawrence grade IV changes. Given the severity of radiographic findings and the failure of an adequate trial of conservative therapy, I am recommending the patient proceed with total knee arthroplasty.

Please contact this office with any questions regarding the patient's clinical history or to request additional records.

Sincerely,

Michael Chen, MD
